# Hawle-Butterfly valve

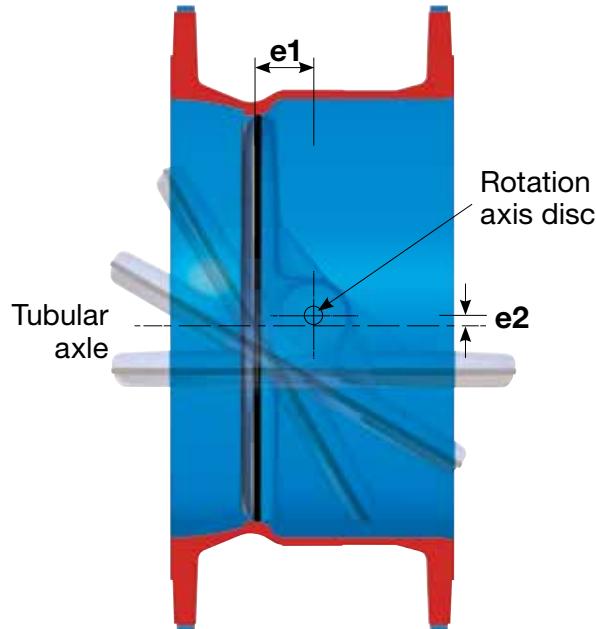

made for generations.

# Welcome to the world of Hawle

Hawle is one of the world's leading manufacturers of individual valve solutions. We are a proud producer of high performance double eccentric butterfly valves including all necessary accessories and equipment in accordance with standard and European norms. Custom made valves for special applications and/or operating conditions are part of our unique speciality.

Our know-how spans a variety of applications. Combining the years of experience with our clear understanding of various customer demands, enables us to configure the optimal valve for our industrial and waterworks customers. A comprehensive service programme ensures years of satisfying product performance.

**Design Features of the Hawle-Butterfly valve**

**Installation variants of the butterfly valve**

Standard with handwheel  
No. 9881K

**Accessories for standard butterfly valve**

Actuator  
No. 9920

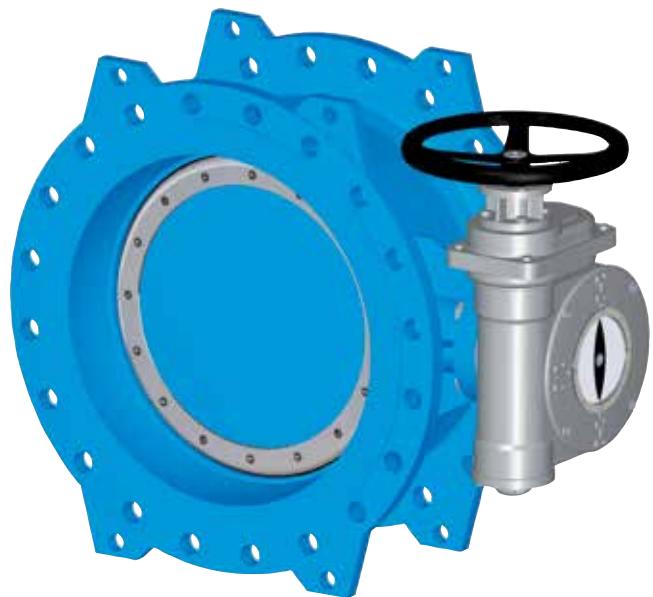

Square cap  
No. 2161

Adaptor  
No. 9211  
Adaptor for extension  
spindle E2/E3, DN 200

The first eccentricity (**e1**) brings the axis of rotation outside the sealing axis. That's why full circle sealing between body seat and sealing ring is achieved. The second eccentricity (**e2**) brings the rotation axle of the disc from the tubular axle. By the help of the second eccentricity the sealing ring is off seated after only a few degrees of movement at open direction. The purpose of the second eccentricity is to quickly relieve rubber seal compression in the area of the disc shafts to eliminate rubber "scuffing" and abrasive wear.

When the valve is open, the rubber is completely unstressed, in this case no permanent compression is retained, even if the valve remains open for years.

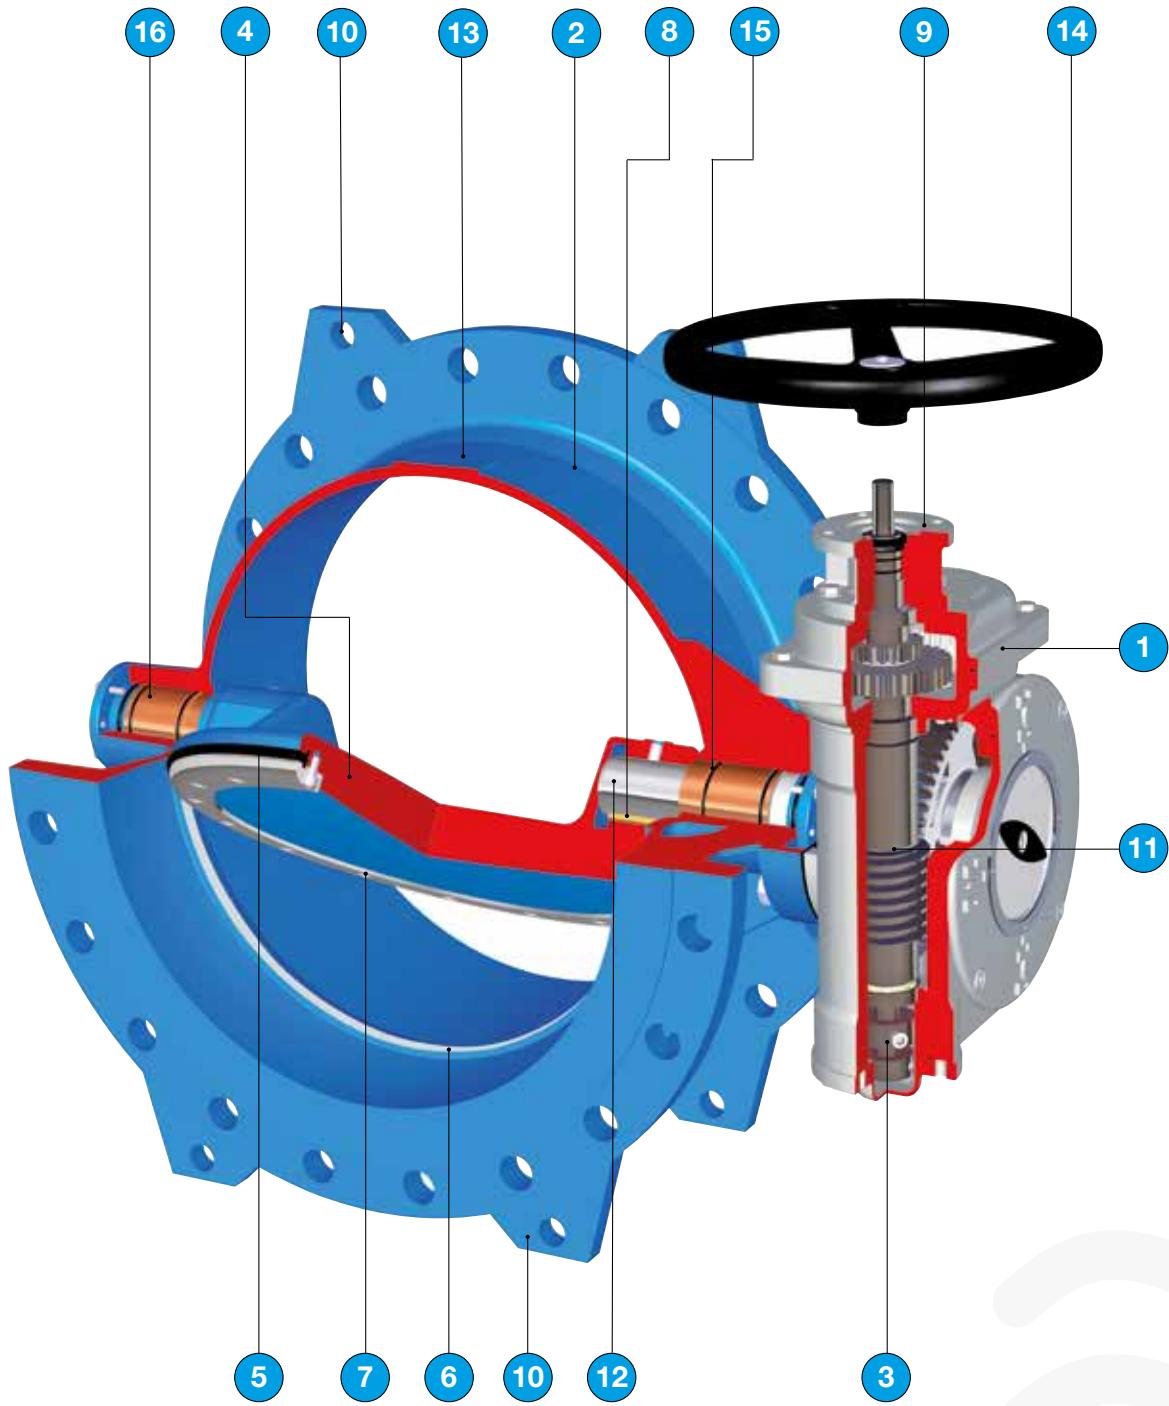

### Advantages of double eccentric butterfly valves:

- in open position, sealing ring is completely unstressed
- the forces for opening / closing of the valves are very low
- while opening / closing the sealing ring does not touch the seating area
- long lifetime of the sealing ring
- sealing ring can be easily replaced at site without special tool requirements
- different to centric butterfly valve, the seat has 360° uninterrupted sealing area, therefore the valves are drop tight according to EN 12266 –A

## Technical characteristics

	Standard configuration
<b>Art. No.</b>	9881K
<b>Design</b>	EN 593 Double flanged, double eccentric
<b>Protection class</b>	Gearbox and butterfly IP 68
<b>Nominal sizes</b>	DN 150 – 1400
<b>Pressure rate</b>	PN 10, PN 16
<b>Medium</b>	Potable water, industrial water, raw water
<b>Face to face length</b>	EN 558 – 1 Series 14 (Option: Series 13)
<b>Flanges</b>	EN 1092 – 2 PN 10 / 16
<b>Body</b>	Ductile iron
<b>Disc</b>	Ductile iron
<b>Sealing ring</b>	EPDM-Rubber
<b>Shaft</b>	Stainless steel
<b>Body seat</b>	Stainless steel weld overlay & micro finished
<b>Retaining ring</b>	Stainless steel (Option: steel coated)
<b>Internal fixings</b>	Stainless steel
<b>External fixings</b>	Stainless steel
<b>Bearing bush</b>	Bronze
<b>Coating</b>	Internal and external epoxy-coated, min. 250 µm thickness according DIN 30677-2
<b>Operation</b>	Manual by worm gearbox and handwheel (Option: electric, pneumatic, hydraulic, actuator)
<b>Medium temperature</b>	According to EN 1074
<b>Colour</b>	RAL 5012
<b>Closing direction</b>	Clockwise (Option: anti clockwise)
<b>Gearbox</b>	Position 01 A with handwheel, other versions on request (see page 6)

# Design features

## 1 Protection class IP 68

Butterfly valve and gearbox have protection class IP 68, therefore the standard butterfly valve is suitable for either buried installation or chamber installation.

## 2 Body

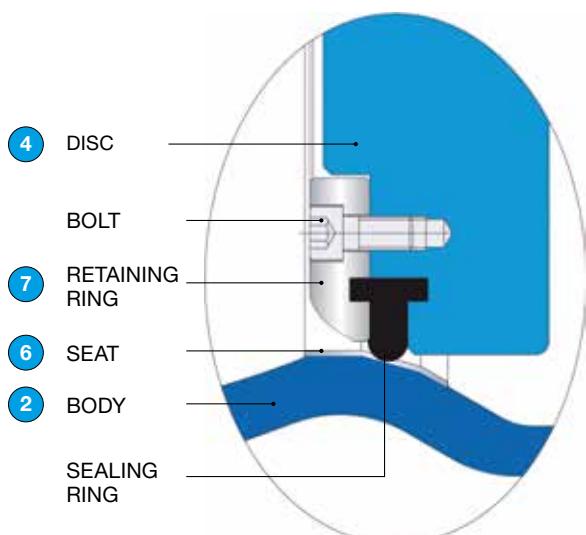

Streamline design and smooth finish of the body provides minimum resistance to flow.

## 3 Travelling nut

Bottom end of the worm shaft is threaded and a travelling nut moves up and down on this threaded spindle. When operating the gear (valve) in "open" or "close" direction, the travelling nut also moves towards the corresponding end stop and prevents the over travel of the valve disc.

## 4 Disc

Streamlined and low profiled disc including closed hubs ensuring higher Kv values. Double offset disc design reduces seal wear and torque.

## 5 Sealing system

Sealing on seat face is ensured by an endless T-profile resilient sealing ring which is held on the periphery of the disc by a retaining ring. In closed position the sealing ring is pressed against the conically shaped seat face of the body and provides safe sealing in either direction of flow. In opened position the sealing ring is completely unstressed due to the double eccentric disc design.

## 6 Body seat

Stainless steel weld filled and finished integral body seat ensures a corrosion and erosion resistant seat face. With this special type of seating it is possible to manufacture the valve drop tight.

## 7 Retaining Ring

The one piece retaining ring prevents sealing ring from rolling out. Sealing ring can be replaced easily at site without dismantling the valve disc and without requirement of any special tool.

## 8 Shaft connection

Positive disc to shaft connection by use of key.

## 9 Top flange

All butterfly valves are equipped with ISO top flanges for all types of actuator- operator connections.

## 10 Lifting holes and feet

Integral lifting holes provide easy installation and feet ensure strong ground support.

## 11 Worm gear operators

Are designed for easy operating of butterfly valve by only one operator

## 12 Shafts

Stub shaft design provides minimal restriction to flow.

## 13 Unique tracking number

Every valve is equipped with a cast tracking number for easy traceability and identification.

## 14 Handwheel

Every valve is equipped with a handwheel (standard version).

In combination with the gearbox, the valve is designed for one man operation.

Other accessories for operation i.e. electric actuator or head stock on request.

## 15 Shaft sealing

Multiple O-ring shaft sealing system ensures maintenance free sealing for the entire life span.

## 16 Bearing system

Self lubricating plain bearings reduce shaft friction and operating torque. These bearings keep the shaft centralised and prevent axial movement.

# Worm gear operators

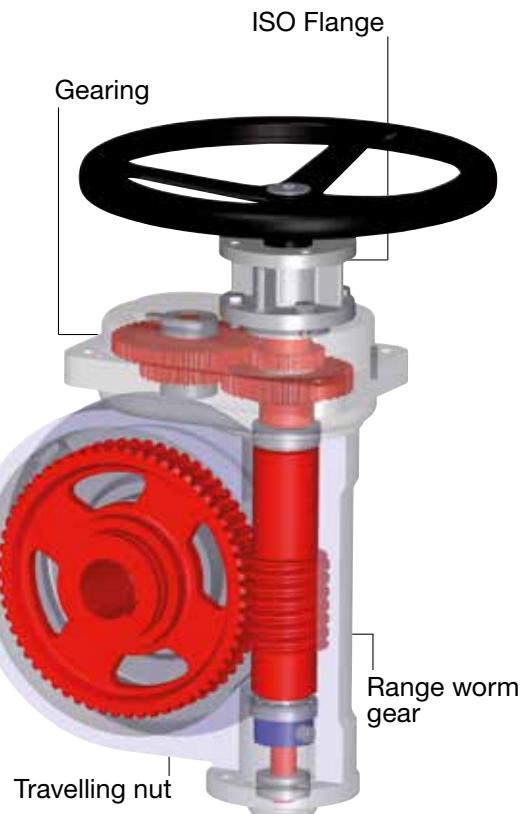

TK-TYPE range worm gear operators have been designed for the operation of butterfly valves. Worm gear operators offer a quarter turn ( $90^\circ$ ) motion that is required with butterfly valves and disc motion is limited at open and closed positions by travelling nut system.

Self locking (irreversible) gear design guarantees the correct operation and tightness of butterfly valves.

Nine types of worm gear operators cover the torque requirements of the whole range of butterfly valves.

## Design Features

- Robust design
- Factory set  $90^\circ$  swing angle. Setting of the end stop by travelling nut system
- Gearbox mounted direct to the valve without intermediate flange
- Valve attachment according to ISO 5211
- Self locking worm gearing with minimum backlash
- ISO 5210 top flange for mounting of multi-turn actuators
- Mechanical position indicator

## Possible positions for worm gear operators:

Flow direction of medium

Opening direction disc

- Design 01:**
- Standard
  - Gear left side
  - opening with flow direction

- Design 02:**
- Optional
  - Gear right side
  - opening with flow direction

- Design 03:**
- Optional
  - Gear left side
  - opening against flow direction

- Design 04:**
- Optional
  - Gear right side
  - opening against flow direction

## Possible positions for handwheels:

- Design A:**
- Standard
  - Handwheel top

- Design B:**
- Optional
  - Handwheel right

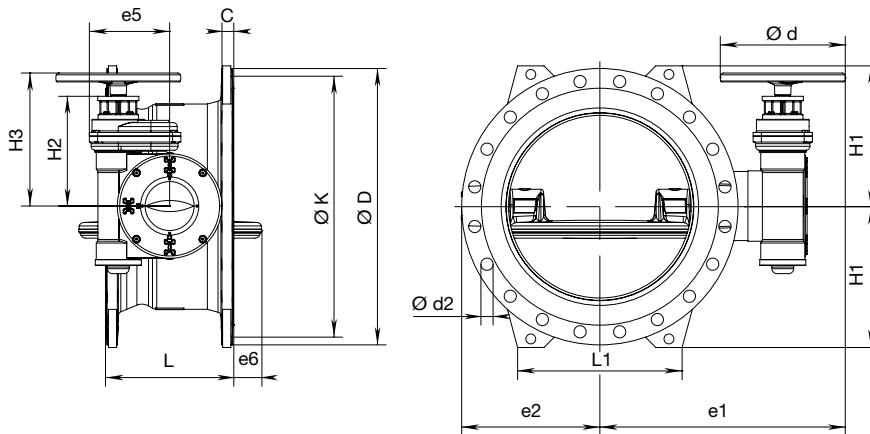

- Design C:**
- Optional
  - Handwheel left

- Design D:**
- Optional
  - Handwheel below

# Range of products for water extraction + water transmission

## Tilting type check valves

Are designed as short body, small volume and light weight. The double offset disc is kept in the open position and the degree of disc opening depends on the velocity of flow. They can be mounted in the vertical or horizontal pipeline application. Adjustable weight offers the adaptability to the individual working conditions. These valves are available with metal to metal or resilient seating options.

**DN 150 – 1400** PN 10, PN 16, PN 25

No. 9883

## Tilting type check valves with hydraulic damper

If the backflow reaches the check valve before the disc is closed, the result will be slam closing and water hammer. Tilting Disc Check Valves with Hydraulic Damper eliminates slam closing and water hammer for the entire closing stroke. Closing speed is adjustable, depending on working conditions. All components of the valve are designed for high stress occurred during damping effect.

**DN 150 – 1000** PN 10, PN 16, PN 25

No. 9884

## Slanted Seat Check Valves

Slanted seat check valves are equipped with a seating plane, creating an angle with the vertical plane to reduce the swing angle and closing time. These check valves can be used in all non return applications.

On request slanted seat check valves can be supplied with external end-stage dampers.

The advantage is a better closing characteristic due to the smaller swing angle of the disc. Due to this the closing time is reduced compared to other check valve types.

No lever and counter weight requirement. These valves are available with metal to metal (9885) or resilient (9886) seating.

**DN 200 – 1200** PN 10, PN 16, PN 25

No. 9885 / 9886

# mission

## Silent check valves

Silent check valves are designed to meet non-slam, fast closing characteristics. Spring loaded disc and short closing stroke provides quick response to flow changes. Thus water hammer is minimized and non-slam, quick closing is achieved. Full waterway design provides full pipeline cross section area around the disc in the open position, and assures lowest possible head loss. They are suitable for high flow velocities.

**DN 100 – 1000** PN 10, PN 16, PN 25, PN 40

**No. 9887**

## Dismantling joints

Are double flanged fittings which allow longitudinal adjustment in flanged pipe systems. It has been developed to provide greater flexibility at both the planning and installation stages of flanged pipework systems and for easy maintenance of flanged valves.

**DN 50 – 1600** PN 10, PN 16, PN 25

**No. 9810**

## Foot valves

Installed in pump suction lines. The foot valve prevents the water column from draining off upon pump stop.

**DN 100 – 1000** PN 10, PN 16, PN 25

**No. 9888**
